

Latex Font Color Example

```
tbl_colored <- dplyr::tribble( ~grpname, ~count, ~color,
                              'apple', 1, 'red',
                              'banana', 2, 'yellow',
                              'grape', 3, 'purple',
                              'pear', 4, 'green',
                              'orange', 5, 'orange')

gt(data = tbl_colored) %>%
  tab_style(
    style = cell_text(color = "#ffcccb"),
    locations = cells_body(columns = everything(),
                           rows = startsWith(grpname, 'a'))
  ) %>%
  tab_style(
    style = cell_text(color = "#ffffed"),
    locations = cells_body(columns = everything(),
                           rows = startsWith(grpname, 'b'))
  ) %>%
  tab_style(
    style = cell_text(color = "#b19cd9"),
    locations = cells_body(columns = everything(),
                           rows = startsWith(grpname, 'g'))
  ) %>%
  tab_style(
    style = cell_text(color = "#90ee90"),
    locations = cells_body(columns = everything(),
                           rows = startsWith(grpname, 'p'))
  ) %>%
  tab_style(
    style = cell_text(color = "#fed8b1"),
    locations = cells_body(columns = everything(),
                           rows = startsWith(grpname, 'o'))
  ) %>%
  cols_label(.list = list(
    grpname = 'Fruit',
    count = 'Total',
    color = 'Color'
  )) %>%
  tab_source_note(
    c(
      paste0('Script code: ', knitr::current_input()),
      paste0('Tex code: ', gsub('.Rmd', '.tex', knitr::current_input()))
    )
  ) %>%
  as_latex()
```

Fruit	Total	Color
apple	1	red
banana	2	yellow
grape	3	purple
pear	4	green
orange	5	orange
